Anatomists of Empire Jan 26 2023 The 20th-century anatomists Grafton Elliot Smith, Frederic Wood Jones and Arthur Keith travelled the globe collecting, cataloguing and constructing morphologies of the biological world with the aim of weaving these into a new vision of bio-ecology that links humans to their deep past as well as their evolutionary niche. They dissected human bodies and scrutinised the living, explaining for the first time the intricacies of human biology. They placed the body in its environment and gave it a history, thus creating an ecological synthesis in striking contrast to the model of humanity that they inherited as students. Their version of human development and history profoundly influenced public opinion as they wrote prolifically for the press; they published bestsellers on human origins and evolution; they spoke eloquently at public meetings and on the radio. They wanted their anatomical insight to shape public policy. And by changing popular views of race and environment, they moulded attitudes as to what it meant to be human in a post-Darwinian world—thus providing a potent critique of racism.

At the Margins Apr 24 2020 As a Christian who has functioned at the interface of biomedical science and faith for the whole of his professional life, Gareth Jones is aware of the tensions and misunderstandings that frequently arise both inside and outside the church. In this book he argues that Christians should not underestimate the importance of scientific contributions to an understanding of God's world. He works this out by reference to his own experiences in approaching a number of contentious topics. These include the use of embryos in reproductive technology research; the place of vaccines in combatting viral pandemics like COVID-19; and understanding the gender debate. Other examples he uses are the treatment of a genetic condition like cystic fibrosis and the importance of using only donated bodies for teaching and research in anatomy. In working at these borderlands, he recognizes that the best of biomedical science brings glory to God and enhances human existence. All these areas are

transformed by applying Christian values, such as the dignity and equality of human beings. Over the years he has learned how to be comfortable working in these borderlands, even as they raise questions that trouble many within both society and the churches.

Women's Bodies in Classical Greek Science May 26 2020

In this book, Dean-Jones gives a close analysis of theories concerning women's bodies in such authors as the Hippocratics and Aristotle. She demonstrates the centrality of menstruation in classical theories of female physiology, pathology, and reproduction, and suggests that this had both negative and positive repercussions in attitudes towards women's bodies in that society. Many of the primary sources dealt with are not yet accessible in English, therefore, her book is important in assembling and presenting both original texts as well as her research on the texts.

The Institutional Repository Aug 09 2021 Providing a thorough review of the concept of the Institutional Repository (IR) the book examines how they can be set up, maintained and embedded into general institutional working practice. Specific reference is made to capturing certain types of research material such as E-Theses and E-Prints and what the issues are with regard to obtaining the material, ensuring that all legal grounds are covered and then storing the material in perpetuity. General workflow and administrative processes that may come up during the implementation and maintenance of an IR are discussed. The authors notes that there are a number of

different models that have been adopted worldwide for IR management, and these are discussed. Finally, a case study of the inception of the Edinburgh Research Archive is provided which takes the user through the long path from conception to completion of an IR, examining the highs and lows of the process and offering advice for other implementers. This allows the book the opportunity to introduce extensive practical experience in unexpected areas such as mediated deposit. A comprehensive synthesis of the whole of the IR system – never before provided in other books The research results that it contains, are at the leading edge of this subject area Includes a comprehensive case study and examination of practical experience – never before provided in other books

The book not only raises key ethical questions concerning the study, display, and curation of skeletal remains that bioarchaeologists must face and overcome in different countries, but also explores how this global community can work together to increase awareness of similar

and, indeed, disparate ethical considerations around the world and how they can be addressed in working practices. The key aspects addressed include ethics in bioarchaeology and forensic anthropology, the excavation, curation, and display of human remains, repatriation, and new imaging techniques. As such, the book offers an ideal guide for students and practitioners in the fields of bioarchaeology, osteoarchaeology, forensic anthropology, medical anthropology, archaeology, anatomy, museum and archive studies, and philosophy, detailing how some ethical dilemmas have been addressed and which future dilemmas need to be considered.

Human Anatomy Oct 31 2020 "Anatomia clavus et clavis medicinae est." Anatomy is a fundamental science that studies the structure of the human body from ancient times. Over time, the discipline constantly expands with recent progress that has been produced in researching the human body. So, new methods of researching were incorporated in the anatomy development: plastic materials injections, plastination, computed techniques of sectional bodies, and embryology. Anatomic sections like macroscopic, mesoscopic, microscopic, and public anatomies; radiologic anatomy; computed anatomy; radiologic anatomies; and clinical anatomy contribute to realize a very complex discipline that represents the base of learning medicine.
